

Assignment #05

Variables and functions are an important part of C++ programming because they help in organizing and managing the program properly. Variables are used to store data, while functions help to reuse code and reduce repetition.

Formal parameters are written inside the function definition, whereas actual parameters are the values passed to the function when it is called.

- local variable work only inside the function
- while global variable can be accessed through the Program.
- Inline functions are used for small functions and help improve execution speed.

Maxim.....

Formal & Actual parameters

```
#include <iostream>
using namespace std;
```

```
int add (int a, int b) {
    return a + b;
}
```

```
int main () {
```

```
    cout << add (2, 3);
    return 0;
```

```
}
```

local variable

```
#include <iostream>
using namespace std;
```

```
int show () {
    int x = 10;
    cout << x;
```

```
}
```

```
int main () {
    show();
    return 0;
```

```
}
```

Global variable

```
#include <iostream>
using namespace std;
```

```
int num = 20;
```

```
int display () {
```

```
cout << num;
```

```
}
```

```
int main () {
```

```
display ();
```

```
return 0;
```

```
}
```

Inline function:

```
#include <iostream>
```

```
using namespace std;
```

```
inline int square (int x) {
```

```
return x * x;
```

```
}
```

```
int main () {
```

```
cout << square (4);
```

```
return 0;
```

```
}
```
